

Meeting with Dean Feldman-20260806_090041-Meeting Recording

6 August 2026, 07:00am

48m 7s

Note: this meeting was partially in person and partially on Teams and therefore the transcript is hard to follow

DF

Dean Feldman started transcription

BS

Ben Swartz 1:39

Yeah.

Okay.

I'm saying we are we just doing like a basically a standoff now.

DF

Dean Feldman 1:45

But now.

Yeah, I guess I haven't prepared for that. I know when I did this one, we don't have to upload, I think.

BS

Ben Swartz 1:53

K.

DF

Dean Feldman 2:01

We have to upload it, but just in case they want, we might as well just record it.

BS

Ben Swartz 2:06

Yeah.

Okay.

DF

Dean Feldman 2:08

I don't think this stand-up has to be the same format it was last time. We have to look at what the chapter is in the methodology. I'm just making a change to the read me. Will you just accept it, Ben? Because I think I've made a...

BS **Ben Swartz** 2:15

But.

DF **Dean Feldman** 2:20

Mistake to the links that I've put up.

BS **Ben Swartz** 2:24

Yeah, I'll change it after the after the call.

DF **Dean Feldman** 2:31

Let's see.

Hey.

The ITR calculations.

Please, please, please.

I know what link I got, just the wrong link here.

Bye bye.

The.

GR **Gabriel Raz** 3:03

No.

DF **Dean Feldman** 3:05

Show properly in the car.

BS **Ben Swartz** 3:07

Up.

GR **Gabriel Raz** 3:08

Yeah, sorry.

And got hours.

DF **Dean Feldman** 3:11

That's OK.

GR **Gabriel Raz** 3:16

I'm sorry about the merge conflicts, but I think those 3 files shouldn't be too hectic. I think it's because I updated one of the files with my transcript. JSON file, I think I reformatted because it said it needed to be reformatted with prettier.

DF **Dean Feldman** 3:33

Okay.
I mean, it doesn't matter, you just go fix it. It doesn't affect us, it only affects you. So you don't have to apologise to us.

GR **Gabriel Raz** 3:39

Okay.
I appreciate the patience, though, because, like I said last semester, we didn't do much.
It was all just one, kind of doing everything, so, like, I appreciate the patience with.

DF **Dean Feldman** 3:57

It's okay, don't worry.

GR **Gabriel Raz** 3:59

Alright.

DF **Dean Feldman** 4:00

What? I have to watch that video that he posted and how do not have to watch.
What actually did he? From Devon. From Devon. No friend. What video did he give? The cat or something. Did he give a video? And how did I have to re-sign in every time? He gave the PAT thing, the personal access tokens. It's not a video, it's a...
It's a document.
If you are dev, OK, let's get this. I have another 44 commits, guys. It's been a day, 44 commits. It's been a day, only 44 in a day. That's a lot of commits. Ohh, we do a lot of work per day long.

Ben Swartz 4:41

Yeah, but this project is only during like a month.

Dean Feldman 4:46

I don't know what's happening. I said when you put in this, you know, his Instagram video, it's like, I thought I'd be like that. Do you know where I was going to make it? He's on the Zoom. Can I talk to her? She's very on time for you. Are we happy? And then I was like, you know, actually going out, but it's such an awkward time. It's time to leave my house, you know, 8:22. I was like 8:30 next.

Gabriel Raz 4:57

Ohh.

Dean Feldman 5:12

8:35 that you say?

How was your week? Awful. I was so impressed to come back to this place. I actually didn't realise how. We are recording. Why? Oh, let me read it. Not yet.

I want to think, because my cheque, as you must do the S.A. 20, but the S.A. 20 only have runs, and you guys say everything, so then like...

Ben Swartz 8:05

No, I can't.

Gabriel Raz 8:06

Yeah.

Dean Feldman 8:07

That's different. That's in the T20, the SA20 is a selected in T20. Yeah. So we can do the Indian T20 if we wanted to, but it also only went for two months.

Gabriel Raz 8:14

Yeah.

Dean Feldman 8:16

That's fine. Nothing's going to move. Art is going to happen. Nothing's going to update the whole time we're doing our thing. Like no steps. Where's cricket happening?

BS Ben Swartz 8:16

No, but.

Wait, the if we do the.

Yeah.

GR Gabriel Raz 8:25

Al.

BS Ben Swartz 8:27

I think if we're going to do a specific tournament, RPL makes no sense. It's been the longest running one, so it's 10s of years for it.

DF Dean Feldman 8:30

Just.

So why don't we just change our sport?

We haven't made a decision; we haven't written it anywhere yet.

Because cricket's definitely the easiest, we just test. Why don't we do like water pole?

I think it's cool.

BS Ben Swartz 8:50

Now, Dad, is there no database with all types of T20 tournaments, not just a single tournament?

GR Gabriel Raz 8:53

I.

DF Dean Feldman 8:58

Yeah, that's pretty good. Otherwise, actually, that's going to be our translator, because we can't hear. We're just going to a room next. We could in the the science grants that.

GR **Gabriel Raz** 9:15
No.

DF **Dean Feldman** 9:26
Connexion. Computer just actually, you were on 0%, you were plugged in until I stopped using it. Yeah. From the battery. So, what are we doing now? What is our plan? I don't think the side guys what our project is. Now, that would be good. I'm happy to do.

GR **Gabriel Raz** 9:35
Oh.

DF **Dean Feldman** 9:43
It's just, I've asked that, so it says actually, sorry, is the one to do, yeah, so for the easiest or we scope, it says Stanford's in 20. Sorry guys, the connexion is not great over here.

GR **Gabriel Raz** 9:55
All good.

BS **Ben Swartz** 9:56
That's OK.

DF **Dean Feldman** 9:57
It's.
Um, yeah, hi, and are we just going with that? That's also my chance.
One sport.
This last week.

GR **Gabriel Raz** 10:08
No.

DF **Dean Feldman** 10:13
What am saying? It says soccer. Mine says soccer, Formula One or cricket.

But soccer is the soccer so much. I know, mine's on instant. That's why you have it on hearts, really. I know, but I like to. Yeah, why would you want it instant? For an answer like this, it can be. Maybe you should do OT 20, then you just know a different. You said it. Why don't you do tennis thing? It says two stars for tennis. We all aim for two stars. We all aim for two stars.

I'm saying for the difficulty, difficulty teacher. All teachers should be at the time of the year this week. Ben's decided all teaching. I think it makes sense, because then we can have like a thing for each different countries to. I don't know how it works. We never got to figure that out. That's next year.

GR **Gabriel Raz** 10:49
Not.

DF **Dean Feldman** 11:06
That's the only thing I know about cricket is from going to the one person, every single game I can't. Look, the best one everybody can do for each one, never read to the one person, let's finish. This is the the three miles. OK, so we'll do.

GR **Gabriel Raz** 11:10
Yes.
Yeah.

DF **Dean Feldman** 11:25
Corrections are straight, scope is manageable, right? It is locally relevant, real time is available. Let's do different files. I see. I can really, we're gonna have an animation like hitting the ball across the screen in the page. That's fine, in a while, but that's what we do. That's in charge of all of the cool looking stuff. I just tell them that you're in charge of that then.

GR **Gabriel Raz** 11:40
Okay.

DF **Dean Feldman** 11:47
Hey, what else do we have to do for this? Well, what's it gonna look like? Why are we working on this sprint? Yeah, definitely. Well, this sprint, Nadav, we can just...

NS **Nadav Sundy** 11:58

You can be unmuted. How is it everybody?

GR **Gabriel Raz** 12:02

How's it?

BS **Ben Swartz** 12:03

How about that?

NS **Nadav Sundy** 12:04

Okay, only I can hear you; the others can't hear you, so...

GR **Gabriel Raz** 12:08

Yeah.

BS **Ben Swartz** 12:09

Okay.

NS **Nadav Sundy** 12:09

Okay, we've decided on all T20s. I'm going to look for a data set now, all T20s, but they should be because there's lots of cricket data sets.

BS **Ben Swartz** 12:19

Yeah, there's times. So that's great. And as soon as we have, I think from the back-end side, the database side, as soon as we have the, when you find one, we search them and then I can make the tables. So that's basically the database is done and everything is set up with the infrastructure.

NS **Nadav Sundy** 12:22

Yes.

In.

Words.

Okay.

As soon as I get my chat working, we'll have a data set.

BS Ben Swartz 12:43

Yeah.

NS Nadav Sundy 12:45

Everyone basics is a project, so saying we're required to tree all of that stuff, and then we have should have a string connexion.

Can look at China, but she can't hear you.

Hey, guys, OK, what do we have to do? I'm looking at this thing, yeah, so we need a version that is 100% we exist, we have short quality fields, and then we need to, we have all members of, we need to, yesterday, you didn't update any of the.

GR Gabriel Raz 13:19

I.

NS Nadav Sundy 13:21

What do you mean? What do you mean? These documents in that you have to update to say we use AR to do those. I said, no, there's a CSV file. We have to update you there. Could we just ignore it, just tell it to her. Apparently, she needs to explain to Leora that she needs to use AR to update the AI.

GR Gabriel Raz 13:30

I...

The.

NS Nadav Sundy 13:46

Shot.

Yeah, anyway, documents I should be already did that very nice, but it we have to have non-trivial content, that will be already very trivial.

That's only because chat and code said it's not allowed to actually, if it's because we're using Git T, it can't, it usually uses GitHub, which is allowed to pull, but because of private Git T, you're not allowed to. So you have to manually, you can give access to it, the same as you can pull to a local, you can definitely authorise it.

I don't know how, but definitely can. Is anyone's, is anyone's internet working? Mine is very dark. My computer one is not for my phone is. I don't know if it's because my

phone is and my computer's not. I think that's strange. I need to add your own. But we need to have those so that it's not trivial.

I will do that. Does that even mean the issues? It looks very trivial. What does that mean? Okay, guys, Ben wants to know, do we have to retain our transcripts or just keep updating the evidence files? I think we have to retain. We have to retain our transcripts. If you're using chat, I found a tool that like downloads your chats for you. Oh, I just found one, so Dean said otherwise. I think yours as well, because sometimes yours doesn't read the last part. Yeah, me too. I just found some just some dodgy extension. Well, at the end of this, it's going to be in the project.

GR **Gabriel Raz** 14:58
Okay.

NS **Nadav Sundy** 15:19
Yeah, actually.

We need to figure out an intermediary, but yeah, I think we need to use, ohh, guys, you need to get the apps.

GR **Gabriel Raz** 15:22
No.

NS **Nadav Sundy** 15:31

We don't have the actions. How did you get into work? How did you get into work? Honestly, say to cheque, let's do this. Oh, we did over 15 hours. And where must we put these transcripts? Then somewhere in the docs. The transcripts must just go somewhere in the docs.

GR **Gabriel Raz** 15:39
No.

NS **Nadav Sundy** 15:54

Yeah, we can make a folder for each person, and then they can upload their. OK, we can do Dean's gonna make a file, and then there'll be a file for each person. So, Dean, you're right, you can figure out that, you find that. That's what I said, no,

yesterday. I didn't say. I did. I have a group. I'll let you go show. Patiently. I was looking for stuff like that. They just.

GR **Gabriel Raz** 16:17
Ohh.

NS **Nadav Sundy** 16:28
You're perfect, you have asthma, you're perfect, perfect working, we can test stuff, and then it was two three, we need to send, what else do we need to decide in this meeting? We need to decide what our apps gonna look like and do. We need to decide what apps gonna look like and do then.

GR **Gabriel Raz** 16:36
1.

NS **Nadav Sundy** 16:49
I think we can't have everything pushed to this thing that we already done, just wrangle, just wrangle. What is wrangle? It's in here, build our front end, render uploads, and spread here. Currently, we're figuring out about the doc situation, what's going on which site and how we're gonna get it to the site, but half of the stuff doesn't work 'cause...
The actions don't work.

GR **Gabriel Raz** 17:13
Is the documentation separate from the one inside of the repository?

NS **Nadav Sundy** 17:17
Yeah, there's two doc sites. I'm not, I still don't really understand why. Why do we have two doc sites? Why is there the one in the repository and why is there? Because the repositories will be uploaded and that connects to the repositories where we upload and that connects to the docs, but currently they're not linked, but they will be linked when Pravesha gets in.

GR **Gabriel Raz** 17:32
The.

NS **Nadav Sundy** 17:38

Stuff and all that, but we can't just upload; everyone can't just put documents on to the new, make sure there's a structure to that documentation that it's, it doesn't have to look perfect at the beginning, yeah, yeah, in the studio, yeah, yeah, yeah, yeah, she's gonna name her stuff, that's not next, what's the next thing you want?

GR **Gabriel Raz** 17:49

1.
Um, I...

NS **Nadav Sundy** 18:01

I don't know what that means. Link actual documents, Jones, doesn't just say it's what's in it.

And it's fine, it's also got, just gave it all our files. Yeah, you can speak as I'm waiting and they can't hear you, so it's just me, so it doesn't matter if they're talking.

GR **Gabriel Raz** 18:09

Art.
Ohh.
Okay.
Oh.
I added a few docs when I was doing the authentication. It should be under security. It should be off and one other. Am I frozen?

NS **Nadav Sundy** 18:32

So, you cut out a little bit of their ***?

GR **Gabriel Raz** 18:35

Yeah.
I think.

NS **Nadav Sundy** 18:39

Everybody's gonna.
They say you have a murder conflict.

Right.

And it.

It adds it to your action. So my message to delete a communication yesterday.

I can tell you.

GR **Gabriel Raz** 19:24

Yo.

NS **Nadav Sundy** 19:25

Push.

So, the question is, you...

I think you're going to see the thing he said. He's like, I want to do this. It's absolutely idiot. I'm not able to see this. No, that's what he said. You don't need to log in. If you sign in.

GR **Gabriel Raz** 19:39

Oh.

Yeah.

Much.

DF **Dean Feldman** 20:11

Something, and the people who sign in, they have the ability to, the people who sign in would then have the ability to affiliate statistics or something. What is it given?

They will be able to choose this database, I suppose. No, we choose, they'll be able to add statistics. Are we going to have a database, a statistics creator?

Like, are we gonna be able to say, "OK, we want a graph that has X, Y, and Z? No, we always say, OK, no, let's, I mean, the project, we're scared of it, and then it stops.

Um, on event dot, every statistic it published should be derived from a record of the individual events that occurred during a single fixture.

Single fixture, you know, six of each match. Yeah, but we can do that. If we put all the data from every match, we can just split it up by each match and we can say, okay, match one, you can split it up by the tassel of the match. And then the match erase a heat.

In the order that they occur.

Yeah, and stored as the total that somebody typed, so that's just database has to be

of events, and we derive the statistics, we can't store the statistics to derive them every time, which is stupid. Yeah, I mean, you can't, last semester we just pulled every single data thing and put it into this one, we have to actually manipulate it inside of the database.

We actually care about the database. Remember, we can just take the stuff in. We're going to store whatever we store. Yeah, it can't be statistic data. We have to create. I'm sure we can find statistic data. Don't do that. Find event, make it. Find quick sheet. It gives me all the event data, all about all information for 22,000 and 20 format.

It's comprising 911 test matches. This derivation is the core of the camp. 5,000 600 to T20 internationals. 320 internationals. We got the point. There's a lot of data. We're reading and which statistics the D expects computer from them depends on the sport the group holds. You should be able to. I'm just. We event we also need to add the ability to.

Then I'm going to send you the start if you want to start. And if you don't have to shout. Being re-entry. Yeah, he's obviously being headphones. He can talk me on one second. The whole, everyone's going to know our project is going to join with us. The very end. So what statistics do we have to store and create from it?

Well, that will be based on the data, so we can't figure that out yet. That's the census. For basic, correct? Yeah, it says you got to store events, we got to create, have statistics on each match and in the order that the matches occur, and then if you change something, it should automatically change ADS. Yes, we also have to add a, so we have to add a submission like a Moodle submission thing.

If you sign in, you.

Oh, that will be... Oops, sorry. Yeah. So we need to have a sign in, come throwing really bad pictures, but I'll explain further. So approved submitters should be able to submit, and each submit should submit within a defined part of the competition. So they will, you know, we should be able to choose the folder that it goes to.

If that makes sense, so each T20, well, I don't know how it's set up, how it's grouped, but we should be able to group it if that makes sense, is what they're saying, I think. All right, anyone approved submitted? Let's start with on your approved submitters. How would you become an approved submitter, guys? Well, we have an admin admin.

That's what we need; we need an admin. So, we documentation, they said there was a merge conflict that you need to resolve or something. Surely, it should be like kind

of like a paid team question, but let's kind of use that log in order to be able to be able to submit. No, but we need someone who has access to this full page.

We need to ask someone who you guys documentation and just cheque.

If you're able to submit data, if you, if you submit crap, you sign up and then it gets reviewed by people. Why don't we just say you sign up and if you submit ****, then you can just review someone. Sign up and approve, and then if you rubbish, I'm gonna write rubbish now. It doesn't look like it has changed much.

Yeah, I don't know what addresses do.

I think it's just easier, right? Yeah. Okay, submit. Each should submit in a defined part of the competition. So it is always clear who supplied a given event. What does that possibly mean? Well, it says this set of data is uploaded by Shayna Winterslap on this day at this time. Part of the competition. So it is clear who supplied a given event. We can we can define that part.

We can define it by year a month or something. It's us. Surely it's defined by each man.

Rejections felt middle in the drunk, and with our friend quietly, every publisher just actually be transferred back to the event and the submission. Right, so we just in the database we have to store.

Yeah, it says we have to have the workflow. This is the example it says, and it's an official statistician and you can log in, you'll upload your match events.json, then there'll be a validate schema, but either will be valid or invalid if it's invalid or return an error.

That will recalculate the statistics, then you'll have a store link which will have your statistics, your events, the submission, and submitter. So, like, no, no, yeah, so that stuff goes all the way into the store link, so that's the back end for the store link. Then the front end for the store link, you'll have a submitter which will go to the submission which will have an.

upload events which will become statistics is what it says. There's two sides to us. There's two sides of it. So there's a store link. You know when you can say upload your documents in Google? That's the middle part. The front end, a submitter will be able to do that, that's fine. The back end is the step, you have someone, a statistician who logs in and we can also upload that stuff.

That's what it's saying. Look at it. It's got two going towards the stalling.

You tell me what it means. Well, but how far from this is that they both beating up? Actually, that just means this is what we pull in. So, is it mostly it's just up to there?

Yeah, I think you upload either we have to start what you upload either a JSON file, a JSON file, because we're gonna work in JSON. Who has JSON files on hand?

All the stuff, everyone, they all work. Jason or whatever we decide. No, it's going to be Jason. Yeah, because this makes sense, because then it's going to be, you know, we have to store in the database. The database also not in the store. Actually, it isn't going to work because it's not an API. It's just. Shayna, look at something I sent you on what, sir.

It also has to store who submitted what. Yes, and then it says, yeah, it tells us what the database will be. So we have a user competition, submitter, assignment, submission, events, and statistics. It should needs to be an API. So it was look at that chat and record it. We pull out those things with quick sheet and then use it.

What are we going to do? We have to connect to an external API, like, like you said, if you're doing a weather thing, you would connect to Google Maps to where you are. Is that an external API? Yeah, well, we can provide our base data if that's fine, like all the historical data, and we can use cricket.org, which you get 100 requests a day on the restricted free.

to get like the current and recent cricket records. Yes, that's that's what we should do. We'll be like, we want you want to go to this game here, you here's the location, you this is how you get there. We need we need to upload our past statistics to our database. That was not fixed. Then, after we've done that, we're going to use this new one that.

Update everything from today, but there's no thing that will do both. OK, is what we say. That's a good Excel API that anyway got distracted from then. OK.

to update if you add. Yeah. API is the platforms product. What does that mean? Let me ask. API is a platform product rather than an accessory to the web database. Does that mean we have to display our API if we were displaying our database?

Connexion interrupt. The internet should. Another app should be able to read pictures, events throughout statistics. Someone else should be able to take our APIs. And pay to the results too large to return it works. I think someone else should be able to take our APIs. The API should be stable. Yeah, it says holding a reference from the last season can still.

We saw that it says we should have a web app that will link to an API, but... will connect to the database. It's what we've got now currently.

That's say what he's saying, and it should be able to export only, that's like focus on the other thing, definitely did last time, right? You already did that, the statistics of

long. That's what it, if you can, if you can understand that picture there, Shaina, on WhatsApp, that's what it says it means, or what we should be doing.

But what your project should do? Mobile app? What will be a web app? What's the research tool?

What it says, why do we have a mobile app, a website for research, and a third party app? Jesus.

Surely, we just have to make the that we have, we don't need a mobile app, no, no, that will be our web app, but it's just the API is a platform's product rather than accessory to the web interface.

Because that's the structure of our thing, you want to understand.

I think it's just more about we have gets and we have gets and what are the things that gets API thing names and then we it's the way an API works, but I don't understand what this.

Put some cut that doesn't actually mean anything, but now we're gonna switch it over. We're just both asking, so I'm not walking through Paris.

Whatever, but the web basically means all the clients apply on Facebook. It says, "Don't build a website with an API. He wants us to build an API that has a website. Our API needs to be that anyone can, if they want to create a data, they someone can go to our website. API as well. I mean, our website actually has to be lasted at stupid one. He told us to look.

Testing.

Next, we must use a weather API to do a mixture, then you will mapping a professional legalisation API, external identity provider for overall. The way we did last time, we had APIs, we made APIs because we needed APIs. This one. That the API is not your. Listen, the last time we made APIs for our needs, right?

This time, they want us to have our APIs available for whenever, regardless of our needs. So here it says what it means, right? You should not score only final tasks in that person. For example, don't only store, and I thought this was for you, player A score 24 points. Instead, you need a 1002 player A score 2 points, and 1118 player A score 2 points. And then from that, we derive.

For twenty-four points, yeah, we storing basic, like the most basic stuff, like literally atomic like crap, but that's what we should get from the JS.

Yeah, calculate statistics from the event. Goals equals count of goals, yellow cards.

Correcting the event must update the statistics. Suppose the middle records players scored with the goal. Later players play 10 scored the goal.

This should automatically remove one golf and play 18 hours to play 10.

That the team fix the statistics and anything else that depending on this, we just need to have.

Basically, yeah, it's summarising the front-end or react, yes, yes, event submitted through the web form. OK, so submission could be Jason, it seems the event submitted through the web form or event sent directly to the API, so that would be your statistics. I'll ask Chat to simplify it. It said it's just more of a front-end back-end, what we did last semester.

That's what this thing should look like. It's also permission, rereading, submitted app events.

This looks rough. No, this is what you were saying. Let's go click the.org, yeah.

When you approve somebody like some maths, right?

If somebody needs to define scope, this is the way I make sure, somebody may be assigned to one team, somebody may be assigned to one venue, somebody may have like an approval group of, but that's what I said, we have to, so we'll have one admin, we'll make an e-mail, ask Raz if you made an e-mail when he set up OAuth. Raz, did you make an e-mail when you set up OAuth?

Well, he had to, but that is, but that is 2 authentication. Two factor. OK, we might use that e-mail then as like the admin e-mail, but we'll see. Can we trainer? No, 'cause it's gonna be 'cause that's gonna have two factor authentication. That's just making our student accounts. No, each of our student accounts can be admins, and then each of our personal accounts will be, but we don't need those, we'll be Ted would be submit. This should also have one admin account just for this thing. You may model something and submit it assigned.

will review any submissions. We have to create an event scheme now, validate submission for accepting them, rejection must explain what's wrong, published statistics must be traceable, statistics, event user calculation, submission containing those events, somebody provided submission.

The API is the main part. The web interface is useful, but the belief is that the API should be treated as the platform's actual product. That means neither developer should be able to use system out using the front end. The API must expose fixtures. So we can't. That is 1 competition event. The API should allow another platform to retrieve.

It's why we lost the success.

Arrived 6. If your requirements must support filtering, and there must support.

Changing the format that fits on a page depending on what device you're on. Tens of thousands of records and you should not return anything in one enormous response to divide the response into pages.

A pagination. OK, you must add it to this file must be stable.

I know this must be able to export all the data, the simplest complete basic workflow.

I want to send you this, just want to make it.

Mmh.

Ask him to give you as a doc.

Give me, can you guys accept this thing on? Yeah, just cheque it.

You don't access to KT, just so I think this is a very good chat, guys. I think we should follow it.

Kitty, not not what is Kitty, just take me to get. Can I do it? I have it open. Oh, then should I do it? Well, you can log in. For request, update the reading. Yeah, on my ones. I thought I could do it. You just hit it, then go to file change, and then hit review, and then hit press wait, it says file change. Files changed.

There should be one there. Okay. And then review, the blue review, you can write the comments, say checked or whatever, and you click approve. And then you'll go merge it for. See, this is much better than having to write the comments. Yeah, but it's much a pain to get someone else to do it. Yeah, but that time, if it's not there, if I pull through implements.

Reviewed on that, right? OK, and then you should should merge it. There you go.

Now, no, that's much better than it's just a pain to get it. It just eliminates us needing to document that we actually just get documented.

Hey, Ben, I've got the script. I just need to download that. Hey, what's next? I'm gonna send this here now, as soon as the things and put it on to get team. It's just straight in. I'm on half, so it takes now.

But I'm going to scroll like that. It's very messing. Right, Shaina, we don't have the current issue to make this. So add it. Then Shaina says, please add it. I can do it. She's in my ChatGPT. No, don't you know what you wanted to do? Make, whatever we do it, whatever we do it now, create. What are you doing?

Create. OK, goodnight.

There should be even a new drip templates on the get.

Just tell him to make sure to assign it to the project. Yeah, make sure to assign it to the project, otherwise, and then it goes to the whole course. OK, next. Are we looking at the intermediate yet, or are we just working on it basic now? PDF to this. I think

we're going to start basic. OK, so we just need to get a good UR. Is not over in front of UR.

Are you gonna make it look nice? Yeah, so look nice. Well, let me send this, send it to the string, the starter. That is the first step.

You add one for Liora as well, so that she know fixes up the, yeah, the documents, yeah, what else do I need to do? I can't do anything. Well, let's see what this PDF says, and we'll start, start it. Can we ask Chad to make a requirement stock of all the user stories and stuff? We don't need to do it, and we don't need user stories, but... Scroll up, it'll still, we can get chat to make them, and we can just distribute it on our WhatsApp chat, but we find a lot of things this stuff on projects isn't helping because we did well, no, yeah, not having anything written, it's all NPR, yeah, like you don't have to spend the time putting it on, so if you can only go to get T through Moodle. Yes. Why? That's why ChatCon access gets here, because it's locally hosted. Is that why it always says incorrect? I don't know what that is, but I know that. Delete your branches once you're done with them. Why? And why are you naming your branches Dean Tax 1 Dean? That automatically did that. We're deleting them. Why are we deleting them? Once it's done, we don't need it, guys. On to me.

Is that part of Git methodology? Can we not automate that? No, yes, you can. When you press come back, there's a button that says delete branches. Does it? But you have to press the button. Oh, I didn't know about that. And you must delete your branches. Yeah, well, you can delete all of them except for ours as one, because they're all up. It failed to authenticate.

It's just been really annoying. He's the worst, except for Raza. Don't, don't delete them. How do you use GT? Because he wants control. Because he's controlling. He's actually. So now we can't. Which one's Raza's? The OAuth one. Because we decided he's associate. So DU code, you can see that's a leader one.

Actually, go knock the man at the point. I'm not deleting your line because they're in blocked. What does that mean? I pushed everything. The issues are closed. It's not closed, but what I've done, I've set it up so that wins.

So, in case of an issue, I don't know what actually to do. So, then can I cheque out to back to the my branch that I used to make the documentation? Is this a different issue? You must using a different branch? No, I'm actually just clean it to use a different branch. If it's because each issue needs to be different. So, if it's a new issue, use a new branch.

OK, anyways, I'm sending this now. What's next? What's our plan?

I'll make a new e-mail later. By everyone, we can make that out. I saw a database, I guess. Can we change it? Show me what your request.

What do you do? You go something, and then you go file. I'll change, but don't. I'm not gonna. Yeah, read. And then you'll write a comment and you'll click approve.

Sick. And then once you've done that, it will allow you to close it. Hey, listen, I've sent a document. Everyone give me your thoughts on that. If you're happy with it, then I'll ask you have to make it into issues and upload them.

And then, do they can you can you ask chat to split it up by person? Well, no, but people can choose what they want, like we don't have to. I don't want to make choices if chat can make the choices. Then, does the docs you just seem to have the issue that Ben's working on? No, no, it doesn't. What the doc is, is just a breakdown of the basics requirements in there.

Rubric, and if, once everyone's read it and happy, I'll make it into issues, and then we can start working on it. OK, right, let's see version controls. Are we done?

We need to make it work on every device. Okay, what is that?

Indigenous.

Then, are you doing just the schema and must I do one for the database script or are you doing contracts? It says front and back end in contracts.

For now.

Andrews and API. OK, because it says what we did last, I think, what I think if we copy exactly what we did for the database last semester with those APIs, we'll be fine, because that's exactly the same thing.

Yeah, but I'll give it once everyone's happy with this. I'll give it.

Yeah, looking at that.

Okay.

I'm going to create an issue for my script then. Shana, will you add to this that says users must be able to sign up, sign in, reset their password, and delete passwords? Shouldn't users also be able to upload things when they've signed in? Yeah, but this is the sign in actually. Oh, never mind, that's for authentication and security.

It doesn't really make a difference if you get a couple and place a chat for the bit, but I guess it's a feature, or no, maybe at all.

Keep that.

All those eyes, if you open one. We're not doing football. Why did they give football here? So that person pass, I'll get started. OK, let's put a football example here, but we're not playing that.

Dean did that. What did I do? The templates. Which template? When I pass and features, I change them a little bit. Right. Which ones? Tell me. If you press create an issue, you press new issue and you choose what it is correctly. I do that. Well, it was there and then I just changed what they.

The templates, 'cause your templates are what the bug, the feature, the toss, the I didn't make that. Chat must have done something, there's something in my chat, it keeps instead of just giving me logged down, it's stuck.

My 2 branches. Well, are you done with them? Have you moved your issues on the projects close? Yeah, yeah. Then you can delete. The one you closed was wrong. Which one did I close? You had to was wrong. Needing a branch. Oh, issuing projects. It's a project loading.

Then we can run the, whatever, I'm having it.

It's not done, not truly done, but. Is it truly done? No, no, it's waiting for that part's done. The documentation. What we've done is done, but it's not overall documentation. No, no, no, it's done. That one. Don't delete this. Don't delete these. So, you can't do it.

I've deployed the public documentation. Yeah, yeah, that's so yours is done. You need to go into the, like resolving the conflict.

Yeah, actually they just wait, they can't happen, so please, OK.

Didn't cheque on these.

That's your criteria you need to do before you can. Technically, you should do it before you make it into that. OK. So let me actually just move it out of that. Oh, no, no. Just go kick it. Go make a checklist of the stuff. And I know it does successfully. What was it called? The W1?

Hey, Sharon, this looks good. I'm happy with this thing that you've sent.

So, Laura, I'm going to make an issue for you now, and then why do I have to put an issue blocked and say, when it can be, and then there's a little, the preceding thing was maybe the system, and then also there's a CSV file that you have to go edit. No, no, but this is just for making that for issue.

You'll see, if you give it to chat and you say, "Help me update that," to update, hey, once I'm just very good.

Because you're at the Azure front-end deployment, which you should cover.

Yeah, did you use MK Docs?

I thought I did.

And, and you said to the same thing, that's not the middle.

OK, so I'm gonna make this for you now, and then you can, so, so, OK, it's taking another hour, you know, this one.

I know, because I don't know, I just can't be forward. Simple, plain and simple.

There's always an issue. Yeah, but this is the setting up stuff. This stuff is going to be available, but once you set it up and once the RCD is working, you just literally have to change files and fold, change files, add files, exchange code, and all that. This is the.

Definitely, give me just gonna give me the declaration, and then I'll ask it, it's just not enough, but not our viewers gets the reports through chat, and then there's 'cause there's multiple places that you...

Issue AR as well. Then put that in your commit. I use in other things, other issues. Last at the bottom, AR declaration. The preceding issue was planned and generated with the system. Is this for an empty file? Yeah. I don't know if my MD files do that.

Because, is there any decisions that we need to do, or can we? Well, everyone's happy with this doc I just said. Has everyone reviewed the the doc chain as said? If they have, I trust you guys, I trust you guys. What am I going to read it for? You go to branches, just, yeah, just get you to do whatever decisions, and you don't have to make the fool.

Things you could just make 6 issues, and each issue will say, "This is what's done in here. Just be very careful not to do anything without an issue. If there's an issue, either create is this needed. I don't understand what this is. What is that? Do I need this? Like, I don't know. It's just giving me, like, my my I ask colleague, can I end this call? Yeah, end this.
